

Building a Fresh Wildfire Localhost

1. Go to the [Wildfire Bitbucket page](#).

2. Click **Clone**.

3. On the *Clone this repository* modal, click the **Copy** button.
4. In your Terminal, **cd** to your localhost folder.
5. Run the following commands:

```
git clone git@bitbucket.org:kamedia/wildfire.git  
your_new_site_folder_name  
  
cd your_new_site_folder_name  
  
git checkout develop5  
  
composer install
```

6. In your browser, go to your PhpMyAdmin page (or other DB tool).
7. Create an empty database for your new localhost site. Note the name, login, and password for later.
8. Go to https://localhost/your_new_site_folder_name/web.
9. Complete the *Wildfire 5* installation process, using your new DB name, login, and password.
10. Complete the Initial Setup process. For testing purposes:
 - a) Select the desired theme.
 - b) Add as many languages as needed.
 - c) Add and translate as many pages as needed.
11. Go to your new site's home page and check that everything is in place.
